

TITLE

Novel Guanidine Mimics as Factor Xa Inhibitors

FIELD OF THE INVENTION

5 This invention relates generally to novel guanidine mimics which are inhibitors of trypsin-like serine protease enzymes, especially factor Xa, pharmaceutical compositions containing the same, and methods of using the same as
 10 anticoagulant agents for treatment and prevention of thromboembolic disorders.

BACKGROUND OF THE INVENTION

WO 96/28427 describes benzamidine anticoagulants of the
 15 formula:

wherein Z¹ and Z² are O, N(R), S or OCH₂ and the central ring may be phenyl or a variety of heterocycles. The presently
 20 claimed compounds do not contain the Z¹ linker or the substitution pattern of the above compounds.

WO 95/13155 and PCT International Application US 96/07692 describe isoxazoline and isoxazole fibrinogen receptor antagonists of the formula:

25 wherein R¹ may be a basic group, U-V may be a six-membered aromatic ring, W-X may be a variety of linear or cyclic groups, and Y is an oxy group. Thus, these compounds all
 30 contain an acid functionality (i.e., W-X-C(=O)-Y). In

contrast, the presently claimed compounds do not contain such an acid functionality.

EP 0,513,387 depicts active oxygen inhibitors which are oxazoles or thiazoles of the formula:

5

wherein X is O or S, R² is preferably hydrogen, and both R¹ and R³ are substituted cyclic groups, with at least one being phenyl. The presently claimed invention does not relate to these types of oxazoles or thiazoles.

WO 95/18111 addresses fibrinogen receptor antagonists, containing basic and acidic termini, of the formula:

15

20

wherein R¹ represents the basic termini, U is an alkylene or heteroatom linker, V may be a heterocycle, and the right hand portion of the molecule represents the acidic termini. The presently claimed compounds do not contain the acidic termini of WO 95/18111.

In U.S. Patent No. 5,463,071, Himmelsbach et al depict cell aggregation inhibitors which are 5-membered heterocycles of the formula:

25

30

wherein the heterocycle may be aromatic and groups A-B-C- and F-E-D- are attached to the ring system. A-B-C- can be a wide variety of substituents including a basic group attached to an aromatic ring. The F-E-D- group, however, would appear to be an acidic functionality which differs from the present invention. Furthermore, use of these compounds as inhibitors of factor Xa is not discussed.

Baker et al, in U.S. Patent No. 5,317,103, discuss 5-HT₁ agonists which are indole substituted five-membered heteroaromatic compounds of the formula:

wherein R¹ may be pyrrolidine or piperidine and A may be a basic group including amino and amidino. Baker et al, however, do not indicate that A can be a substituted ring system like that contained in the presently claimed heteroaromatics.

Baker et al, in WO 94/02477, discuss 5-HT₁ agonists which are imidazoles, triazoles, or tetrazoles of the formula:

wherein R¹ represents a nitrogen containing ring system or a nitrogen substituted cyclobutane, and A may be a basic group including amino and amidino. But, Baker et al do not indicate that A can be a substituted ring system like that contained in the presently claimed heteroaromatics.

Tidwell et al, in *J. Med. Chem.* **1978**, 21(7), 613-623, describe a series of diarylamidine derivatives including 3,5-bis(4-amidinophenyl)isoxazole. This series of compounds was tested against thrombin, trypsin, and pancreatic kallikrein. The presently claimed invention does not include these types of compounds.

Activated factor Xa, whose major practical role is the generation of thrombin by the limited proteolysis of prothrombin, holds a central position that links the intrinsic and extrinsic activation mechanisms in the final common pathway of blood coagulation. The generation of thrombin, the

final serine protease in the pathway to generate a fibrin
clot, from its precursor is amplified by formation of
prothrombinase complex (factor Xa, factor V, Ca^{2+} and
phospholipid). Since it is calculated that one molecule of
5 factor Xa can generate 138 molecules of thrombin (Elodi, S.,
Varadi, K.: *Optimization of conditions for the catalytic
effect of the factor IXa-factor VIII Complex: Probable role of
the complex in the amplification of blood coagulation.*
Thromb. Res. **1979**, 15, 617-629), inhibition of factor Xa may
10 be more efficient than inactivation of thrombin in
interrupting the blood coagulation system.

Therefore, efficacious and specific inhibitors of factor
Xa are needed as potentially valuable therapeutic agents for
the treatment of thromboembolic disorders. It is thus
15 desirable to discover new factor Xa inhibitors.

SUMMARY OF THE INVENTION

Accordingly, one object of the present invention is to
provide novel guanidine mimics which are useful as factor Xa
20 inhibitors or pharmaceutically acceptable salts or prodrugs
thereof.

DEFINITIONS

40 The compounds herein described may have asymmetric
centers. Compounds of the present invention containing an
asymmetrically substituted atom may be isolated in optically
active or racemic forms. It is well known in the art how to
prepare optically active forms, such as by resolution of
racemic forms or by synthesis from optically active starting

materials. Many geometric isomers of olefins, C=N double bonds, and the like can also be present in the compounds described herein, and all such stable isomers are contemplated in the present invention. Cis and trans geometric isomers of the compounds of the present invention are described and may be isolated as a mixture of isomers or as separated isomeric forms. All chiral, diastereomeric, racemic forms and all geometric isomeric forms of a structure are intended, unless the specific stereochemistry or isomeric form is specifically indicated.

The term "substituted," as used herein, means that any one or more hydrogens on the designated atom is replaced with a selection from the indicated group, provided that the designated atom's normal valency is not exceeded, and that the substitution results in a stable compound. When a substituent is keto (i.e., =O), then 2 hydrogens on the atom are replaced. Keto substituents are not present on aromatic moieties.

The present invention is intended to include all isotopes of atoms occurring in the present compounds. Isotopes include those atoms having the same atomic number but different mass numbers. By way of general example and without limitation, isotopes of hydrogen include tritium and deuterium. Isotopes of carbon include C-13 and C-14.

When any variable (e.g., R^6) occurs more than one time in any constituent or formula for a compound, its definition at each occurrence is independent of its definition at every other occurrence. Thus, for example, if a group is shown to be substituted with 0-2 R^6 , then said group may optionally be substituted with up to two R^6 groups and R^6 at each occurrence is selected independently from the definition of R^6 . Also, combinations of substituents and/or variables are permissible only if such combinations result in stable compounds.

When a bond to a substituent is shown to cross a bond connecting two atoms in a ring, then such substituent may be bonded to any atom on the ring. When a substituent is listed without indicating the atom via which such substituent is bonded to the rest of the compound of a given formula, then such substituent may be bonded via any atom in such

substituent. Combinations of substituents and/or variables are permissible only if such combinations result in stable compounds.

As used herein, "C₁₋₆ alkyl" is intended to include both
5 branched and straight-chain saturated aliphatic hydrocarbon groups having the specified number of carbon atoms, examples of which include, but are not limited to, methyl, ethyl, n-propyl, i-propyl, n-butyl, i-butyl, sec-butyl, t-butyl, pentyl, and hexyl; "Alkenyl" is intended to include
10 hydrocarbon chains of either a straight or branched configuration and one or more unsaturated carbon-carbon bonds which may occur in any stable point along the chain, such as ethenyl, propenyl, and the like.

"Halo" or "halogen" as used herein refers to fluoro,
15 chloro, bromo, and iodo; and "counterion" is used to represent a small, negatively charged species such as chloride, bromide, hydroxide, acetate, sulfate, and the like.

As used herein, "carbocycle" or "carbocyclic residue" is intended to mean any stable 3- to 7-membered monocyclic or
20 bicyclic or 7- to 13-membered bicyclic or tricyclic, any of which may be saturated, partially unsaturated, or aromatic. Examples of such carbocycles include, but are not limited to, cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl, cycloheptyl, adamantyl, cyclooctyl,; [3.3.0]bicyclooctane,
25 [4.3.0]bicyclononane, [4.4.0]bicyclodecane (decalin), [2.2.2]bicyclooctane, fluorenyl, phenyl, naphthyl, indanyl, adamantyl, or tetrahydronaphthyl (tetralin).

As used herein, the term "heterocycle" or "heterocyclic system" is intended to mean a stable 5- to 7- membered
30 monocyclic or bicyclic or 7- to 10-membered bicyclic heterocyclic ring which is saturated partially unsaturated or unsaturated (aromatic), and which consists of carbon atoms and from 1 to 4 heteroatoms independently selected from the group consisting of N, O and S and including any bicyclic group in
35 which any of the above-defined heterocyclic rings is fused to a benzene ring. The nitrogen and sulfur heteroatoms may optionally be oxidized. The heterocyclic ring may be attached to its pendant group at any heteroatom or carbon atom which

results in a stable structure. The heterocyclic rings described herein may be substituted on carbon or on a nitrogen atom if the resulting compound is stable. If specifically noted, a nitrogen in the heterocycle may optionally be quaternized. It is preferred that when the total number of S and O atoms in the heterocycle exceeds 1, then these heteroatoms are not adjacent to one another. It is preferred that the total number of S and O atoms in the heterocycle is not more than 1. As used herein, the term "aromatic heterocyclic system" is intended to mean a stable 5- to 7-membered monocyclic or bicyclic or 7- to 10-membered bicyclic heterocyclic aromatic ring which consists of carbon atoms and from 1 to 4 heteroatoms independently selected from the group consisting of N, O and S. It is preferred that the total number of S and O atoms in the aromatic heterocycle is not more than 1.

15 The phrase "pharmaceutically acceptable" is employed
herein to refer to those compounds, materials, compositions,
and/or dosage forms which are, within the scope of sound
medical judgment, suitable for use in contact with the tissues
of human beings and animals without excessive toxicity,
20 irritation, allergic response, or other problem or
complication, commensurate with a reasonable benefit/risk
ratio.

As used herein, "pharmaceutically acceptable salts" refer
to derivatives of the disclosed compounds wherein the parent
25 compound is modified by making acid or base salts thereof.
Examples of pharmaceutically acceptable salts include, but are
not limited to, mineral or organic acid salts of basic
residues such as amines; alkali or organic salts of acidic
residues such as carboxylic acids; and the like. The
30 pharmaceutically acceptable salts include the conventional
non-toxic salts or the quaternary ammonium salts of the parent
compound formed, for example, from non-toxic inorganic or
organic acids. For example, such conventional non-toxic salts
include those derived from inorganic acids such as
35 hydrochloric, hydrobromic, sulfuric, sulfamic, phosphoric,
nitric and the like; and the salts prepared from organic acids
such as acetic, propionic, succinic, glycolic, stearic,
lactic, malic, tartaric, citric, ascorbic, pamoic, maleic,

hydroxymaleic, phenylacetic, glutamic, benzoic, salicylic, sulfanilic, 2-acetoxybenzoic, fumaric, toluenesulfonic, methanesulfonic, ethane disulfonic, oxalic, isethionic, and the like.

5 The pharmaceutically acceptable salts of the present invention can be synthesized from the parent compound which contains a basic or acidic moiety by conventional chemical methods. Generally, such salts can be prepared by reacting the free acid or base forms of these compounds with a
10 stoichiometric amount of the appropriate base or acid in water or in an organic solvent, or in a mixture of the two; generally, nonaqueous media like ether, ethyl acetate, ethanol, isopropanol, or acetonitrile are preferred. Lists of suitable salts are found in *Remington's Pharmaceutical*

 "Prodrugs" are intended to include any covalently bonded carriers which release the active parent drug according to
20 formula (I) *in vivo* when such prodrug is administered to a mammalian subject. Prodrugs of a compound of formula (I) are prepared by modifying functional groups present in the compound in such a way that the modifications are cleaved, either in routine manipulation or *in vivo*, to the parent
25 compound. Prodrugs include compounds of formula (I) wherein a hydroxy, amino, or sulfhydryl group is bonded to any group that, when the prodrug or compound of formula (I) is administered to a mammalian subject, cleaves to form a free hydroxyl, free amino, or free sulfhydryl group, respectively.

 "Stable compound" and "stable structure" are meant to
35 indicate a compound that is sufficiently robust to survive isolation to a useful degree of purity from a reaction mixture, and formulation into an efficacious therapeutic agent.

SYNTHESIS

The compounds of the present invention can be prepared in a number of ways known to one skilled in the art of organic synthesis. The compounds of the present invention can be synthesized using the methods described below, together with synthetic methods known in the art of synthetic organic chemistry, or by variations thereon as appreciated by those skilled in the art. Preferred methods include, but are not limited to, those described below. The reactions are performed in a solvent appropriate to the reagents and materials employed and suitable for the transformations being effected. It will be understood by those skilled in the art of organic synthesis that the functionality present on the molecule should be consistent with the transformations proposed. This will sometimes require a judgment to modify the order of the synthetic steps or to select one particular process scheme over another in order to obtain a desired compound of the invention. It will also be recognized that another major consideration in the planning of any synthetic route in this field is the judicious choice of the protecting group used for protection of the reactive functional groups present in the compounds described in this invention. An authoritative account describing the many alternatives to the trained practitioner is Greene and Wuts (*Protective Groups In Organic Synthesis*, Wiley and Sons, 1991). All references cited herein are hereby incorporated in their entirety herein by reference.

One general synthesis of compounds of Formula I where ring M is N-linked is shown in Scheme 1a. Q, B' and R^f are protected functional groups that can be converted to R, B and R^{1a} respectively. D-E can also be called P1, the sidechain that fits into the S1 pocket of fXa. The compounds can also be obtained by changing the sequences of the reaction steps as described in Scheme 1a. For N-linked M ring, the appropriate heterocyclic aniline is treated under conditions described in "The Chemistry of Heterocyclic Compounds, Weissberger, A. and Taylor, E. C. Ed., John Wiley & Sons" or as described later in

the synthesis section to give N-linked ring M. Further modifications and deprotections give N-linked ring M with R, Z-A-B and R^{1a} substituents.

5

SCHEME 1a

For Nitrogen-linked heterocycle M.

In Scheme 1b is shown how to obtain compounds wherein ring M is C-linked and is either five- or six-membered. The aniline from Scheme 1a is diazotized with nitrous acid and treated with NaBr to give the heterocyclic bromide. Treatment with n-BuLi followed by DMF gives an aldehyde which can be converted to ring M as described in "The Chemistry of Heterocyclic Compounds, Weissberger, A. and Taylor, E. C. Ed., John Wiley & Sons" or as will be described. Other precursor functional groups like acid, cyanide, methylketone, etc. can also be used to form the ring M. Further modifications and deprotections can yield five-membered ring M substituted with R, Z-A-B and R^{1a}. The corresponding C-linked six-membered ring M can be obtained by converting the above bromide with n-butyl lithium and triisopropyl borate to give the heterocyclic boronic acid. Suzuki coupling with the appropriate heterocyclic bromide, followed by modifications and deprotections gives the C-linked six-membered ring M with R, Z-A-B and R^{1a} substituents.

5

Scheme 2a shows the synthesis of 2-aminoisoquinoline P1 in which the groups R^{1a} and Z-A-B are attached to the pyrazole C-3 and C-5 respectively. Synthesis begins with 7-aminoisoquinoline (*J. Chem. Soc.* **1951**, 2851). Diazotization and reduction with stannous chloride converts the aryl amine to a hydrazine (*J. Org. Chem.* **1956**, 21, 394) which condenses with a R^{1a} and Z-H substituted keto-oximes to furnish pyrazoles with high regioselectivity (*J. Heterocycl. Chem.*

10

1993, 30, 307). Coupling of the resultant Z-H substituted pyrazoles with fragment A-B' is accomplished using standard procedures for Z as a carboxylic, amino or sulfonic moiety. For Z as a carboxylate the coupling is accomplished using

5 Weinreb's procedure (*Tetr. Lett.* **1977**, 48, 4171) with primary amines of the type H₂N-A-B'. 1-Amination of the isoquinoline is accomplished via formation of the N-oxide followed by treatment with tosyl chloride and then ethanolamine (U.S. Patent No. 4,673,676). Alternatively, the amination

10 transformation may be accomplished via treatment of the isoquinoline N-oxides with phosphoryl chloride. Subsequent displacement of the resultant 1-chloro substituent is done with appropriate reagents. Deprotection of groups on fragment Z-A-B' gives final product.

15

SCHEME 2a

- 5 In Scheme 2b is illustrated the preparation of 5-amino substituted 1,6-naphthrydine compounds. Compounds of this type can be prepared from 3-nitro-1,6-naphthrydine (*Tetr.* **1989**, 45, 2693). Reduction to the corresponding amine will allow for transformation to the desired 5-membered nitrogen containing heterocycle with R^f and Z-H substitution.
- 10 Introduction of a 5-amino moiety may be accomplished through the 5-chloro compound (*Chem. Pharm. Bull.* **1969**, 17, 1045) as previously described in Scheme 2a. Suitable protection of the amino substituent is employed before introduction of fragment
- 15 A-B'. Conversion to the final product may be accomplished in an analogous fashion to that described in Scheme 2a.

SCHEME 2b

5 In Scheme 2c is shown how to prepare isoquinolines, which contain a 1,5-diamine substituent, from 7-aminoisoquinoline by suitable protection of the amine as an amide, directed nitration, and deprotection of the amine a 5-nitro-7-aminoisoquinoline may be obtained. The desired 5-membered
10 nitrogen containing heterocycle with R^f and Z-H substitution may be synthesized as previously shown in Scheme 2a. The addition of fragment A-B' and the 1-aminoisoquinoline portion would be accomplished as described earlier. The transformation of A-B', R^f , and the 4-nitro substituent to A-B, R^{1a} , and a 4-amino group, respectively, is accomplished by
15 previously outlined methods.

SCHEME 2c

In Scheme 2d is shown how to prepare isoquinolines which contain 1,4-diamine substitution. From 7-aminoisoquinoline, the desired 5-membered nitrogen containing heterocycle with R^f and Z-H substitution may be synthesized as previously shown in Scheme 2a. Nitration to the isoquinoline 4 position may be accomplished using standard conditions to afford a 4-nitro moiety. The addition of fragment A-B' and the 1-aminoisoquinoline portion can be accomplished as described earlier. The transformation of A-B', R^f , and the 4-nitro substituent to A-B, R^{1a} , and a 4-amino group, respectively, is accomplished by previously outlined methods.

SCHEME 2d

Scheme 3 illustrates the preparation of an intermediate for 3-aminobenzisoxazole and 3-aminoindazole. Compounds of this general type can be obtained from a fluorocyanobenzaldehyde prepared from commercially available 2-fluoro-5-methylbenzonitrile by first bis-bromination in a nonprotic solvent in the presence of AIBN or other suitable free radical initiator at a temperature ranging from ambient temperature to the reflux temperature of the selected solvent or under a UV light. The bis-bromo compound may then be converted to an aldehyde using a protic solvent in strong acidic or basic conditions at ambient temperature or higher. The aldehyde or the acid equivalent can then be converted to

various C-linked ring M by methods which will be described later.

SCHEME 3

Scheme 4 outlines the formation of C-linked aminobenzisoxazoles. The aminobenzisoxazole P1 can be obtained by first treating the oxime of acetone with potassium t-butoxide in an aprotic polar solvent, followed by the addition of the fluorocyanophenylheterocycle H and then treatment with a protic solvent under strongly acidic conditions (*J. Heterocycl. chem.* **1989**, 26, 1293). Coupling and deprotection as described previously gives 3-aminobenzisoxazoles of Formula I.

SCHEME 4

Scheme 5 outlines the formation of the C-linked 3-aminoindazoles of Formula I. Protection of the aldehyde as propylene ketal by standard conditions followed by refluxing with hydrazine in ethanol gives 3-aminoindazole ketal. Protection of the amino group with CBZCl and deprotection of the ketal with HCl/MeOH gives the aldehyde. The aldehyde or the acid equivalent can be converted to various C-linked

heterocycles as described later. Coupling and deprotection as described previously gives 3-aminoindazoles of Formula I.

SCHEME 5

5

Scheme 6 illustrates the preparation of aminobenzimidazole aldehyde which can be carried onto the C-linked or N-linked heterocycles by the methods described later in the synthesis section. Cyclization of 3,4-diaminobenzoate to give cbz-protected 2-aminobenzimidazole followed by DIBAL reduction and oxidation gives the desired aldehyde.

15

SCHEME 6

Scheme 7 illustrates the preparation of N-linked aminobenzisoxazoles, aminoindazoles, diaminoquinazolines and aminoquinazolines of Formula I. Compounds of this type can be made from the aniline derivative prepared from commercially available 2-fluoro-5-nitrobenzonitrile using tin(II) chloride or other compatible reducing agents in a protic or an aprotic solvent with or without a miscible co-solvent at from ambient temperature to reflux temperature of the selected solvent

The N-linked 3-aminobenzisoxazoles and 3-aminoindazoles can be obtained as described previously. The N-linked aminoquinazoline and diaminoquinazoline P1's can be obtained by condensing the fluorocyano compound with formamidine acetate or guanidine hydrochloride (*J. Heterocycl. Chem.* **1988**, 25, 1173).

SCHEME 7

- 5 Scheme 8 illustrates the preparation of 1-amino-2-benzopyrazine P1 heterocyclic intermediates leading to compounds of Formula I. Compounds of this general type can be obtained from an aminostilbene prepared from commercially available 2-cyano-4-nitrotoluene by first condensing the
- 10 nitrotoluene with benzaldehyde or one of its analogs in an alcoholic solvent in the presence of an alkoxide base at a temperature ranging from -10 °C to the reflux temperature of the selected solvent. The nitrostilbene may then be reduced
- 15 to aminostilbene by reaction with tin(II) chloride or another compatible reducing agent in a protic solvent with or without a miscible co-solvent at ambient temperature or higher. The aniline may then be carried on to the N-linked or C-linked heterocycles H by the methods previously described.

SCHEME 8

Scheme 8 also further outlines transformation of the N-linked and C-linked (not shown) heterocyclic stilbenes to give 1-aminophthalazines of Formula I. Oxidative cleavage of the stilbene double bond according to the method of Narasimhan et al (*Synth. Commun* **1985**, 15(9), 769) or Sheu et al (*J. Am Chem. Soc.* **1990**, 112, 879) or their equivalent should give an aldehyde. The aldehyde can be treated with hydrazine neat or in a polar or apolar solvent at ambient temperature or up to the reflux temperature of the solvent selected to cause ring closure. Group Z-H can then be coupled with group H₂N-A-B according to the methods outlined in Scheme 2a.

The N-linked and C-linked heterocyclic 2-cyanobenzaldehydes prepared in Scheme 8 can also be used as convenient starting materials for the preparation of N-linked 1,3-diaminoisoquinoline intermediate of Scheme 9 and C-linked (not shown) 1,3-diaminoisoquinoline intermediate of Scheme 9 by appropriate adaptation of the chemistry outlined below. The 2-cyanobenzaldehyde can be reduced to the benzylic alcohol by a hydride reducing agent, preferably sodium borohydride, then treated with a sulfonylchloride, methane sulfonyl chloride as suggested by Scheme 9 or an equivalent, using a trialkylamine base and a dry chlorocarbon solvent with cooling. The mesylate and biscyano intermediates can also be

converted to the corresponding 1-aminoisoindole P1 and 1-amino-3,4-dihydroisoquinoline P1 respectively.

SCHEME 9

5

Scheme 10 illustrates another approach to preparing the N-linked and C-linked heterocyclic benzylic alcohols intermediates. These compounds may be obtained from 2-cyano-4-nitro-toluene by photochemical benzylic bromination with N-bromosuccinimide in carbon tetrachloride with a sun lamp and at reflux in the presence of a catalytic amount of a radical initiator such as AIBN or dibenzoylperoxide. The benzylic bromide is then readily displaced with potassium acetate under phase transfer conditions using 18-crown-6 as the phase transfer agent along with water and a non-miscible organic co-solvent with or without heating. The resulting acetate is then hydrolyzed with aqueous acid or by transesterification with anhydrous acid in an alcoholic solvent to give a benzylic alcohol. Depending upon the further demands of the chemistry involved in heterocycle formation step(s) the benzylic alcohol may be protected according to the methodology recommended by Greene and Wuts. The nitro group of the resulting product can

then be reduced to the aniline according to the methods outlined above for Scheme 8 and then carried on to N-linked and C-linked heterocyclic benzylic alcohols of Scheme 10. It should be recognized that these benzylic alcohols can be readily transformed into the benzylic sulfonate ester intermediates of Scheme 9 or oxidized to the benzaldehyde of Scheme 8 by methods known to the skilled practitioner.

SCHEME 10

The compounds of the present invention in which the D-E residue is isoquinazolin-1-one can be prepared as described in Scheme 11. For compounds which are N-linked to heterocycle M, the reaction of 5-nitroisatoic anhydride with formamide at 150°C affords 7-nitroisoquinazolin-1-one which can be reduced to the corresponding 7-aminoisoquinazolin-1-one by a variety of reducing agents. Diazotization, reduction to the hydrazine and N-heterocycle formation can be carried out to afford the isoquinazolin-1-one N-linked to the appropriate heterocycle. For compounds which are C-linked to heterocycle M, the reaction of 5-bromoanthranilic acid with formamide at 150°C affords the 7-bromoisoquinazolin-1-one. This bromide can be converted into an aldehyde or acetyl group which can be then converted into the appropriate C-linked heterocycle.

SCHEME 11

5 The compounds of the present invention in which the D-E residue is isoquinolin-1-one can be prepared as described in Scheme 12. For compounds which are N-linked to heterocycle M, oxidation of 7-nitroisoquinoline to its corresponding N-oxide followed by sequential treatment with acetic anhydride and

10 then hydroxide will produce the desired 7-nitroisoquinolin-1-one. This transformation can be carried out with other reagents as well. Reduction of the nitro group and subsequent formation of the N-heterocycle will afford the isoquinolin-1-one N-linked to the appropriate heterocycle. For compounds

15 which are C-linked to heterocycle M, analogous chemistry can be used to prepare desired 7-bromoisoquinolin-1-one, which can then be converted into the appropriate aldehyde or acetyl group for subsequent conversion to the C-linked heterocycle. One method for conversion of the bromide to an acetyl group

20 employs palladium catalysed coupling with (ethoxyvinyl)tributyltin followed by acid hydrolysis of the intermediate vinyl ether residue.

SCHEME 12

- 5 Compounds wherein D-E is 3-aminobenzisothiazole are exemplified by synthesis on the pyrazole core as shown in Scheme 13. The 4-fluoro-3-cyano-pyrazole intermediate as described previously can be used. Displacement of the fluoro
- 10 with a thio nucleophile followed by the standard Weinreb coupling methodology should afford the desired coupled thiobenzyl intermediate. The nitrile can be converted to the amidine via standard conditions. Oxidation of the sulfide to the sulfoxide with MCPBA followed by the standard closure
- 15 adopted by Wright et al for the isothiazolones with trichloroacetic anhydride should afford the desired amino-isothiazolones.

SCHEME 13

- 5 Compounds in which the M-heterocycle is thiazole can be prepared according to the procedures described in Scheme 14. The appropriate Q-D-E bromide can be converted into a beta-keto ester in several ways. One preferred method involves transmetallation with an alkyl lithium reagent followed by quenching with DMF to afford the corresponding aldehyde.
- 10 Addition of ethyl diazoacetate in the presence of tin (II) chloride affords the beta-keto ester directly. Other methods are available for this conversion, one of which involves Reformatsky reaction of the aldehyde followed by oxidation to
- 15 the beta-keto ester.

SCHEME 14

- 5 A second method for converting the bromide into a beta-keto ester involves palladium catalysed coupling with (ethoxyvinyl)tributyltin followed by acidic hydrolysis to afford the corresponding acetyl derivative. Many methods exist for conversion of the acetyl derivative to the beta-keto ester, one preferred method involves reacting the acetyl derivative with a dialkyl carbonate in the presence of a base such as sodium hydride or lithium diisopropylamide. The beta-keto ester can be converted into the corresponding thiazole derivatives by bromination with NBS followed by cyclization with an appropriate thiourea or thioamide in a solvent such as ethanol or tetrahydrofuran. A one pot method for this conversion involves treating the beta-keto ester with hydroxytosyloxyiodobenzene in acetonitrile, which forms an intermediate alpha-tosyloxy-beta-keto ester, followed by addition of a thiourea or thioamide to effect cyclization to the corresponding thiazole. Manipulation of the ester group
- 10
- 15
- 20

of these thiazoles can then afford the compounds containing an appropriate Z-A-B group. Where Z=CONH, standard methods of peptide coupling with an appropriate amine can be employed, such as reaction of the ester with an aluminum reagent derived from the amine. Where Z=COCH₂, formation of the acid chloride by standard methods can be followed by addition of an appropriate zinc reagent. The R^{1a} group on the thiazole ring can also be manipulated to provide a variety of different groups. For example, when thiourea is used as the cyclization partner, a 2-aminothiazole is produced. This amino group can be readily diazotized and displaced with the appropriate copper halide to afford 2-halothiazoles. The halogen atom can then be readily displaced by a variety of carbon, nitrogen, oxygen and sulfur nucleophiles to produce a wide variety of alkyl, aryl, heteroatom, and heterocyclic derivatives of R^{1a}.

The tetrazole compounds of this invention where Z is -CONH- can be prepared as exemplified in Scheme 15. An appropriately substituted amine (D-ENH₂) is acylated with ethyl oxalyl chloride. The resulting amide can be converted to the tetrazole either by the methods described by Duncia (*J. Org. Chem.* **1991**, 2395-2400) or Thomas (*Synthesis* **1993**, 767-768, 1993). The amide can be converted to the iminoyl chloride first and then reacted with NaN₃ to form the 5-carboethoxytetrazole (*J. Org. Chem.* **1993**, 58, 32-35 and *Bioorg. & Med. Chem. Lett.* **1996**, 6, 1015-1020). The 5-carboethoxytetrazole is then coupled with an appropriate amine (BANH₂) by the method described by Weinreb (*Tetr. Lett.* **1977**, 48, 4171-4174). Final deprotection as described before yields the desired product.

SCHEME 15

The tetrazole compounds of this invention where Z is -CO- can also be prepared via iminoyl chloride (*Chem. Ber.* **1961**, 94, 1116 and *J. Org. Chem.* **1976**, 41, 1073) using an appropriately substituted acyl chloride as starting material. The ketone-linker can be reduced to compounds where Z is alkyl.

The tetrazole compounds of this invention where Z is -SO₂NH-, -S-, -S(O), SO₂- can be prepared as exemplified in Scheme 16. Appropriately substituted thioisocyanate is reacted with sodium azide to give the 5-thiotetrazole (*J. Org. Chem.* **1967**, 32, 3580-3592). The thio-compound can be alkylated (*J. Org. Chem.* **1978**, 43, 1197-1200) and then oxidized to the sulfoxide and sulfone. The thio-compound can also be converted to the sulfonyl chloride and the reacted with an amine to give the desired sulfonamide. The tetrazole compounds of this invention where Z is -O- can be prepared via the same method described in Scheme 16 by using appropriately substituted isocyanate as the starting material.

SCHEME 16

5 The tetrazole compounds of this invention where Z is -NH-, -NHCO-, -NHSO₂- can be prepared from 5-aminotetrazole, which can be prepared by Smiles Rearrangement as shown in Scheme 17. The thio-compound prepared as described in Scheme 3 is alkylated with 2-chloroacetamide. The resulting compound

10 is then refluxed in ethanolic sodium hydroxide to give the corresponding 5-amino-tetrazole (*Chem. Pharm. Bull.* **1991**, 39, 3331-3334). The resulting 5-amino-tetrazole can then be alkylated or acylated to form the desired products.

SCHEME 17

20 The N-linked imidazole ring M can be synthesized by the synthetic route shown in Scheme 18. Alkylation of D-E-NH₂ with 2-bromoethylacetate followed by reaction with Gold's reagent in the presence of a base, such as NaOMe or LDA, form imidazole ring M.

SCHEME 18

5

Additional imidazole derivatives can be made by the general procedures as described in Scheme 18a. Here, P is a protective group for amino group. E is a substituted group or groups. G is an aromatic ring (six, six-six or five-six ring). R₁ and/or R₂ is H, a substituted alkyl group, or either V or a precursor of (CH₂)_nV. V is nitro, amino, thio, hydroxy, sulfone, sulfonic ester, sulfoxide, ester, acid, or halide. n is 0 and 1. U is aldehyde, ester, acid, amide, amino, thiol, hydroxy, sulfonic acid, sulfonic ester, sulfonyl chloride, or methylene halide. Z, A, and B are the same as those described for formula I.

SCHEME 18a

- 5 A general procedure to make 2,4,5-trisubstituted or 4,5-disubstituted imidazole derivatives is described in Scheme 18b. The starting ester **b** can be obtained by acylation of N,O-dimethylhydroxyamine with ethyl malonyl chloride. After metalation with a lithium reagent, compound **a** can react with **b** to give compound **c**. Compound **c** can also be directly made from
- 10 coupling reaction of **a** with zinc reagent of ethyl malonyl chloride. Compound **c** can be brominated with NBS to form compound **d**, which can react with excess NH_3 and R_1CO_2H to afford compound **e**. The ester group in **e** can be transferred to
- 15 other functionalities, which can be further reacted to give compound **f**.

Scheme 18b

5 The general procedure to make C-linked imidazole ring M is described in Scheme 19. Aldehyde D-E-CHO from Scheme 1 can be converted into cyano compound by treatment with hydroxyamine and then dehydration with POCl_3 . The amidine can be obtained from cyano compound by Pinner reaction, which can be cyclized with alpha-halo ester, ketone or aldehyde to form imidazole ring M.

SCHEME 19

15 Pyrazole ring M of the general Formula I such as those described in Scheme 1 can be prepared by the condensation of an appropriately substituted hydrazine with a variety of diketo esters. Condensations of this type typically afford a

mixture of pyrazole regioisomers which can be effectively separated via silica gel column chromatography (Scheme 20). Hydrolysis of the esters followed by coupling with an appropriate amine can afford the desired amide intermediate.

- 5 Various substituents on the pyrazole can then be manipulated to afford a variety of benzo, heterocyclic and bicyclic compounds.

SCHEME 20

10

- 15 The above methodology when applied to diketo derivatives also affords a mixture of pyrazole regioisomers. These can be further manipulated to afford the compounds of Formula I as shown in Scheme 21.

SCHEME 21

When ketoimides are used for condensations with hydrazines the corresponding pyrazole amino esters regioadducts are obtained (Scheme 22). Conversion of these intermediates to the final compounds of formula I can then be accomplished by the protection of the amino functionality with a suitable protecting group commonly known to those in the art or by derivatization (e.g. sulfonamide) then following the general synthetic strategy to prepare the compounds of this invention.

SCHEME 22

The pyrazole ester intermediate can be further manipulated to the ketones by the cuprate methodology described by Knochel et al (Scheme 23). Alternatively the ester can be reduced to either the alcohol or aldehyde via methods known to those in the art followed by either a reductive amination with an appropriate amine to an alkyl amine or by converting the alcohol to a leaving group which in turn can be displaced with a number of nucleophiles to provide the intermediates which on further manipulations should afford the compounds of this invention.

SCHEME 23

Thio compounds such as those described in Scheme 24 can be easily prepared by the conversion of 5-hydroxy pyrazole to its thiol by treatment with Lawesson's reagent in refluxing toluene.

SCHEME 24

5 Compounds of this invention wherein the pyrazole ring M is replaced with a 1,2,3-triazole can be prepared as outlined in Scheme 25.

SCHEME 25

15 The compounds of this invention where the ring M is 1,2,4-triazole can be easily obtained by the methodology of Huisgen et. al. (*Liebigs Ann. Chem.* **1962**, 653, 105) by the cycloaddition of nitriliminium species (derived from the

treatment of triethylamine and chloro hydrazone) and an appropriate nitrile dipolarophile as in Scheme 26.

SCHEME 26

5

This methodology provides a wide variety of 1,2,4 triazoles with a varied substitution pattern at the 1,3 and 5 positions. Alternatively the 1,2,4 triazoles can also be prepared by the methodology of Zecchi et al (*Synthesis* **1986**, 9, 772) via an aza Wittig condensation (Scheme 27).

SCHEME 27

15

R_2 = alkyl or aryl

Alternatively the 1,2,4 triazoles can also be prepared via the methodology of Sauer et al (*Tetr. Lett.* **1968**, 325) by the photolysis of a cyclic carbonate with an appropriate nitrile (Scheme 28).

SCHEME 28

R^{1a} = Ester, Alkyl, Aryl

R^{1b} = Phenyl or ester

25

For compounds of this invention the esters can be converted to the amide intermediates via the Weinreb methodology (*Tetr. Lett.* **1977**, 48, 4171), i.e., the condensation of an appropriate amine aluminum complex with the ester (Scheme 29).

SCHEME 29

Isoxazoline ring M of formula I wherein the 4 and 5 positions are substituted can be prepared following the 1,3-dipolar cycloaddition methodology outlined in Scheme 30. An appropriate benzhydroximinoyl chloride or heterocyclic oximinoylchloride or oxime when subjected to 1,3-dipolar cycloaddition protocol with a suitable 1,2-disubstituted olefin as a dipolarophile should afford a mixture of regioisomers. Separation of the regioisomers by column chromatography followed by the sequence of reactions as described previously should then afford the compounds of choice. Optically active isoxazolines can also be obtained by enzymatic resolution on the regioisomeric esters or by the use of an appropriate chiral auxilliary on the dipolarophile as described by Olsson et al (*J. Org. Chem.* **1988**, 53, 2468).

SCHEME 30

5 In the case of compounds with general formula I wherein Z is an amide the cycloaddition process described in Scheme 30 utilizes an appropriately substituted crotonate ester. The crotonate esters can be obtained from commercial sources or can be obtained from ethyl-4-bromocrotonate by nucleophilic displacement reactions shown in Scheme 31.

10

SCHEME 31

15 Trisubstituted olefins as dipolarophiles can be obtained from ethylpropiolate by the cuprate chemistry (Scheme 32) according to the method described by Deslongchamps et al (Synlett 1994, 660).

20

SCHEME 32

Compounds of this invention with 1,3,4-triazole ring M can be easily obtained via the methodology of Moderhack et al (*J. Prakt. Chem.* **1996**, 338, 169) as in Scheme 33.

5

SCHEME 33

10 This reaction involves the condensation of a carbazide
 15 with an appropriately substituted commercially available thio-
 isocyanate to the cyclic thiourea derivative as described
 previously. Alkylation or nucleophilic displacement reactions
 on the thiono intermediate then affords a thio alkyl or aryl
 intermediate which can be hydrolysed, oxidized and
 decarboxylated to the 5-H-2-thio-triazole intermediate which
 can be effectively converted to the compounds of this
 invention. Alternatively the thiono urea intermediate can be
 oxidized directly to the 2-H-triazole which can then be
 converted to the ester and then subjected to a variety of

reactions shown above to obtain the compounds of this invention. The esters can also be converted to the amine via the Hoffmann rearrangement and this methodology provides a variety of analogs similar to those shown previously. The cyclic thiono urea intermediate can also be oxidized to the sulfonyl chloride by methods shown previously. This in turn can provide the sulfonamides shown in Scheme 34.

SCHEME 34

Scheme 35 describes the general synthesis for pyrazoles which have thio and oxidized sulfur derivatives. An appropriately substituted amine is alkylated with ethyl bromoacetate and hydrolyzed to the glycine derivative. Preparation of the N-nitroso compound was easily achieved with sodium nitrite (*J. Chem. Soc.* **1935**, 899). Cyclization to the syndone using acetic anhydride (*J. Chem. Soc.* **1935**, 899) was following by the introduction of the sulfide unit using a sulfoxide as solvent and acetyl chloride as a activating reagent (*Tetr.* **1974**, 30, 409). Photolytic cleavage of the syndone in the presence of an acetylenic compound the 1,3,5 trisubstituted pyrazole as the major regioisomer (*Chem. Ber.*

1979, 112, 1206). These can be carried on, as described before, to the final compounds containing the sulfide, sulfoxide or sulfone functionality.

5

SCHEME 35

Scheme 36 shows one possible synthesis of isoxazoles.

- 10 Substituted benzaldehydes are reacted with hydroxyl amine then chlorinated to give the hydroximinoyl chloride according to the procedure of (*J. Org. Chem.* **1980**, 45, 3916). Preparation of the nitrile oxide in situ with triethylamine and cycloaddition with a substituted alkyne gives a mixture of
- 15 regioisomeric isoxazoles as shown by H. Kawakami (*Chem. Lett.* **1987**, 1, 85). Preparation of the disubstituted alkyne is achieved by nucleophilic attack of the alkynyl anion on an electrophile as shown by Jungheim et al (*J. Org. Chem.* **1987**, 57, 4007).

- 20 Alternatively, one could make the hydroxyiminoyl chloride of the R^{1a} piece and react it with an appropriately substituted alkyne to give another set of regioisomeric isoxazoles which can be separated chromatographically.

SCHEME 36

Where V = NO₂, SO₂NR₂ or CO₂Me, synthetic precursor to -Z-A-B

5 An alternate procedure which produces only one regioisomer is described in Scheme 37. The methylated form of V can be deprotonated and silylated. Chlorination with carbon tetrachloride or fluorination with difluorodibromomethane under triethylborane catalysis give the geminal dihalo

10 compound as shown by Sugimoto (*Chem. Lett.* **1991**, 1319). Cuprate-mediated conjugate addition-elimination give the desired alkene as in Harding (*J. Org. Chem.* **1978**, 43, 3874).

Alternatively, one can acylate with an acid chloride to form a ketone as in Andrews (*Tetr. Lett.* **1991**, 7731) followed

15 by diazomethane to form the enol ether. Each of these compounds can be reacted with a hydroximinoyl chloride in the presence of triethylamine to give one regioisomeric isoxazole as shown by Stevens (*Tetr. Lett.* **1984**, 4587).

SCHEME 37

Where Y = OMe, Cl or F
V = NO₂, SO₂NR₂ or CO₂Me, synthetic precursor to -Z-A-B

When core substituent R^{1a} is $CH_2-R^{1'}$, the synthesis is shown in Scheme 38. After being treated with LDA, the ketone starting material reacts with $PhSSO_2Ph$ to give the phenylthiolated compound which reacts with hydrazine in acetic acid to form pyrazole derivative. The pyrazole ester reacts with an amine or aniline (previously treated with $AlMe_3$) to provide amide. Oxidation of the sulfide with mCPBA gives the corresponding sulfone. Deprotonation of the sulfone with base, followed by trapping with an electrophile ($E-X$) and treatment with SmI_2 provided the desired compound after deprotection.

SCHEME 38

15

Scheme 39 shows other methods of synthesis for $R^{1a}=CH_2R^{1'}$ or $COR^{1'}$. Protection of the hydroxyl group of hydroxyacetone with a benzyl halide and treatment with a base and $CO(CO_2Et)_2$ gives the tricarbonyl compound. Refluxing with $NH_2OMe \cdot HCl$ in pyridine and ethanol in the presence of molecular sieve 3\AA gives the oxime. Cyclization of oxime with $D-E-NHNH_2$ provided pyrazole, which can be converted into the corresponding amide by reacting with an amine or aniline (previously activated with $AlMe_3$). Debenzylation by catalytic hydrogenation

provides the alcohol. The alcohol is converted into the tosylate with TsCl, followed by replacement with a nucleophile to provide the desired compound. The alcohol can also be oxidized to the corresponding aldehyde or acid, or further converted to ester or amide.

SCHEME 39

10

Scheme 40 shows the synthesis of pyrazole ring with a chloride group. Chlorination of pyrazole starting material obtained previously in Scheme 2a with NCS formed chloropyrazole. The chloropyrazole can be reacted with an aniline in the presence of AlMe_3 followed by amination as described in Scheme 2a to give the desired product.

SCHEME 40

- 5 Scheme 41 describes the synthesis of compounds wherein M is a benzene ring and V is a nitro, protected sulfonamide or ester group and precursor of group Z of Formula I. The V group is placed on an appropriately substituted phenol either via nitration as shown by Poirier et al. (*Tetrahedron* **1989**, 45(5), 1415), sulfonylation as shown by Kuznetsov (*Akad. Nauk SSSR Ser. Khim* **1990**, 8, 1888) or carboxylation by Sartori et al. (*Synthesis* **1988**, 10, 763). Bromination with triphenylphosphine and bromine (*J. Am. Chem. Soc.* **1964**, 86, 964) gives the desired bromide. Suzuki coupling with the appropriate boronic acid provides the desired substituted pyridine.

Scheme 41

20

- 25 Schemes 42-45 describe the synthesis of compounds wherein M is pyridine. Each scheme represents a different substitution pattern for the pyridine ring. In Scheme 42, a suitably protected aldehyde is subjected to base-catalyzed condensation with an activated ester to give after deprotection the desired aldehyde. Refluxing with ammonium chloride as shown by Dornow and Ische (*Chem. Ber.* **1956**, 89,

876) provides the pyridinol which is brominated with POBr_3 (Tjeenk et al. *Rec. Trav. Chim.* **1948**, 67, 380) to give the desired 2-bromopyridine. Suzuki coupling with the appropriate boronic acid provides the desired substituted pyridine.

5

Scheme 42

10

Treatment of an appropriately substituted 5-ethoxyoxazole with an alkene as shown by Kondrat'eva et al. (*Dokl. Akad. Nauk SSSR* **1965**, 164, 816) provides a pyridine with the V substituent at the para position. Bromination at the 3-position as shown by van der Does and Hertog (*Rec. Trav. Khim. Pays-Bas* **1965**, 84, 951) followed by palladium-catalyzed boronic acid coupling provides the desired substituted pyridine.

15

Scheme 43

20

Scheme 44 describes a synthesis of a third substitution pattern on a pyridine ring. The appropriate tricarbonyl compound which can be prepared by methods described in Scheme 42 is treated with ammonium chloride to form the pyridinol which is subsequently brominated. Palladium-catalyzed coupling provides the desired substituted pyridine.

Scheme 44

Scheme 45 takes a suitably substituted dicarbonyl compound and by chemistry illustrated in Schemes 42 and 44, reacts it with ammonium chloride. Bromination gives the 3-bromopyridine which upon palladium-catalyzed coupling provides the desired substituted pyridine.

Scheme 45

Schemes 46-48 describe the synthesis of compounds wherein M is pyridazine. Each scheme represents a different substitution pattern for the pyridine ring. In Scheme 46 an activated ester is reacted with an appropriately substituted

α -keto aldehyde and hydrazine as shown by Schmidt and Druey
 (Helv. Chim. Acta **1954**, 37, 134 and 1467). Conversion of the
 pyridazinone to the bromide using POBr₃ and palladium-
 catalyzed coupling provides the desired substituted
 5 pyridazine.

Scheme 46

10

In Scheme 47, glyoxal can react under basic conditions
 with an activated ketone and subsequently brominated/dehydro-
 brominated to give the desired ketoaldehyde. Alternatively, a
 protected ketone can react with an activated aldehyde, undergo
 15 bromination/dehydrobromination, be deprotected and oxidized to
 give the regioisomeric ketoaldehyde. Cyclization as shown by
 Sprio and Madonia (Ann. Chim. **1958**, 48, 1316) with hydrazine
 followed by palladium-catalyzed coupling provides the desired
 substituted pyridazine.

20

Scheme 47

25

By analogy to Scheme 47, in Scheme 48, a aldehyde can be
 reacted with an activated ketone, brominated, dehydro-
 brominated and deprotected to give the desired diketone.

Alternatively, a regioisomeric ketone can be placed through the same reaction sequence to produce an isomeric keto aldehyde. Reaction with hydrazine followed by palladium-catalyzed coupling provides the desired substituted pyridazine.

Scheme 48

Schemes 49 and 50 describe the synthesis of compounds wherein M is pyrimidine. Each scheme represents a different substitution pattern for the pyrimidine ring. In Scheme 49, a condensation with an appropriately substituted acid chloride and an activated ester followed by conjugate reduction by tin hydride (Moriya et al. *J. Org. Chem.* **1986**, 51, 4708) gives the desired 1,4 dicarbonyl compound. Cyclization with formamidine or a substituted amidine followed by bromination gives the desired regioisomeric pyrimidine. Palladium-catalyzed coupling provides the desired substituted pyrimidine.

Scheme 49

5 Using similar chemistry, Scheme 50 shows how an amidine
 can be condensed with a 1,3-dicarbonyl compound and
 subsequently brominated in the 5-position (*J. Het. Chem.* **1973**,
 10, 153) to give a specific regioisomeric bromopyrimidine.
 Palladium-catalyzed coupling provides the desired substituted
 10 pyrimidine.

Scheme 50

15 Using the same ketoaldehyde from Scheme 50, cyclization
 with an appropriately substituted 1,2-diamine (*Chimia* **1967**,
 21, 510) followed by aromatization (*Helv. Chim. Acta* **1967**, 50,
 1754) provides a regioisomeric mixture of pyrazines as
 20 illustrated in Scheme 51. Bromination of the hydrobromide
 salt (U.S. Patent No. 2,403,710) yields the intermediate for

the palladium-catalyzed coupling step which occurs as shown above.

Scheme 51

Schemes 52 and 53 describe the synthesis of compounds wherein M is a 1,2,3-triazine. In Scheme 52, a vinyl bromide is palladium coupled to a molecule containing the substituent R^{1b} . Allylic bromination followed by azide displacement provide the cyclization precursor. Triphenylphosphine-mediated cyclization (*J. Org. Chem.* **1990**, *55*, 4724) give the 1-aminopyrazole which is subsequently brominated with N-bromosuccimide. Lead tetraacetate mediated rearrangement as shown by Neunhoeffter et al. (*Ann.* **1985**, 1732) provides the desired regioisomeric 1,2,3-triazine. Palladium-catalyzed coupling provides the substituted triazine.

Scheme 52

In Scheme 53, an alkene is allylically brominated and the bromide is displaced to give a regioisomer of the azide in Scheme 52. Following the same reaction sequence as shown above, cyclization provides the 1-aminopyrazole. Bromination followed by lead tetraacetate mediated rearrangement give the

1,2,3-triazine. Palladium-catalyzed coupling provides the other desired triazine.

Scheme 53

5

Schemes 54 and 55 describe the synthesis of compounds wherein M is a 1,2,4-triazine. In Scheme 54, a nitrile is converted using hydrazine to give the amidrazone which is condensed with a α -ketoester to give the triazinone as shown by Paudler and Lee (*J. Org. Chem.* **1971**, 36, 3921). Bromination as shown by Rykowski and van der Plas (*J. Org. Chem.* **1987**, 52, 71) followed by palladium-catalyzed coupling provides the desired 1,2,4-triazine.

Scheme 54

In Scheme 55, to achieve the opposite regioisomer the reaction scheme shown above is modified by the substituting a protect α -ketoester. This allows the most nucleophilic nitrogen to attack the ester functionality setting up the opposite regiochemistry. Deprotection and thermal cyclization gives the triazinone which is brominated as shown above.

Palladium-catalyzed coupling provides the other desired 1,2,4-triazine.

Scheme 55

5

Scheme 56 describes the synthesis of compounds wherein M is a 1,2,3,4-tetrazine. Lithiation of a vinyl bromide, transmetalation with tin, palladium catalyzed carbonylation and hydrazone formation provides a diene for a subsequent Diels-Alder reaction as shown by Carboni and Lindsey (*J. Am. Chem. Soc.* **1959**, *81*, 4342). Reaction with dibenzyl azodicarboxylate followed by catalytic hydrogenation to debenzylate and decarboxylate should give after bromination the desired 1,2,3,4-tetrazine. Palladium-catalyzed coupling provides the desired substitution.

Scheme 56

20

Compounds of this invention where B is either a carbocyclic or heterocyclic residue as defined in Formula I are coupled to A as shown generically and by specific example in Scheme 57, either or both of A and B may be substituted

with 0-2 R⁴. W is defined as a suitable protected nitrogen, such as NO₂ or NHBOC; a protected sulfur, such as S-tBu or SMOM; or a methyl ester. Halogen-metal exchange of the bromine in bromo-B with n-butyl lithium, quenching with triisopropyl borate and acidic hydrolysis should give the required boronic acid, B'-B(OH)₂. The W-A-Br subunit may be already linked to ring M before the Suzuki coupling reaction. Deprotection can provide the complete subunit.

Scheme 57

Scheme 58 describes a typical example of how the A-B subunit can be prepared for attachment to ring M. 4-Bromoaniline can be protected as Boc-derivative and the coupled to 2-(t-butylamino)sulfonylphenylboronic acid under Suzuki conditions. 2-(t-Butylamino)sulfonylphenylboronic acid can be prepared by the method described by Rivero (*Bioorg. Med. Chem. Lett.* **1994**, 189). Deprotection with TFA can provide the aminobiphenyl compound. The aminobiphenyl can then be coupled to the core ring structures as described below.

Scheme 58

For N-substituted heterocycles, Scheme 59 shows how the boronic acid can be formed by a standard literature procedure (Ishiyama, T.; Murata, M.; and Miyaura, N. *J. Org. Chem.* **1995**, *60*, 7508-7510). Copper-promoted C-N bond coupling of the boronic acid and heterocycle can be performed as described (Lam, P.Y.S.; et. al., *Tet. Lett.* **1998**, *39*, 2941-2944). It is preferable to use boroxine or unhindered borate as the boron source. The acid obtained can be condensed with H-A-B' and after deprotection yields the desired product.

SCHEME 59

A synthetic route for making aminobenzisoxazole derivatives with an imidazole core is shown in Scheme 60. Palladium(0)-catalyzed cross-coupling reaction of an alkoxydiboron (pinacol diborate) with a haloarene (see, Ishiyama et al, *J. Org. Chem.* **1995**, *60*, 7508-7510) should afford an arylborate intermediate, which can be hydrolyzed with 4M HCl (10 eq.) in a minimum amount of THF at room temperature to give arylboronic acid. 4-Imidazolecarboxylic

acid can be converted to 4-trifluoromethylimidazole by reacting with SF₄ (3 eq.) and HF (7.5 eq.) in a shaker tube at 40 °C. Copper(II)-catalyzed coupling reaction of arylboronic acid with 4-trifluoromethylimidazole in the presence of
5 pyridine (5 eq.) and 4Å molecular sieves in THF should provide 1-aryl-4-trifluoromethylimidazole. Lithiation of the imidazole with n-BuLi, followed by quenching with methylchloroformate, can give 1-aryl-4-trifluoromethyl-1H-imidazole-5-methylcarboxylate. Nucleophilic replacement of
10 fluorobenzene with pre-mixed potassium tert-butoxide and acetone oxime followed by treatment with 20% HCl in ethanol can form 1-aminobenzisoxazole-4-trifluoromethyl-1H-imidazole-5-methylcarboxylate. The ester may then be converted to an amide by a Weinreb coupling reaction. Alternatively, after
15 the saponification of the ester in aqueous NaOH in THF, the resulting acid can be converted to the corresponding acyl chloride upon treatment with SOCl₂ or oxalyl chloride, followed by reacting with aniline containing an o-substituent to form an amide. Fluorobenzene can similarly be converted to
20 aminobenzisoxazole derivative by treatment with pre-mixed potassium tert-butoxide and acetone oxime, followed by reaction with 20% HCl in ethanol. The ester can also be saponified in aqueous NaOH in THF to give an acid, which then can be coupled with aniline to give amide via a coupling
25 reagent (ex. PyBrop) under basic conditions.

SCHEME 60

5 o-Fluorobenzonitrile derivatives with imidazole core can be converted to 1-aminoquinazoline-1H-imidazole derivatives by treatment with formamidine salt in pyridine and ethanol (Scheme 61).

SCHEME 61

5 Scheme 62 illustrates the preparation of bicyclic core
intermediates leading to compounds with indazole and indole
cores. Compounds of the general type can be obtained by the
method outlined in *Chem. Ber.* (1926) 35-359. The pyrazole N-
oxide can be reduced by any number of methods including
10 triphenylphosphine in refluxing toluene followed by the
hydrolysis of the nitrile substituent to a carboxylic acid
with basic hydrogen peroxide to give indazole intermediate
which may be coupled in the usual way to give indazole
product. Indole intermediate may be obtained via the Fischer
15 Indole Synthesis (*Org. Syn*, **Col. Vol. III** 725) from an
appropriately substituted phenylhydrazine and acetophenone.
Further elaboration using standard synthetic methods including
the introduction of a 3-formyl group by treatment with $POCl_3$
in DMF, the optional protection of the indole NH with the Sem
20 group ($TMSCH_2CH_2OCH_2Cl$, NaH, DMF) and oxidation of the
aldehyde to a carboxylic acid which is now ready for
transformation to indole product.

The chemistry of Table A can be carried out in aprotic solvents such as a chlorocarbon, pyridine, benzene or toluene, at temperatures ranging from -20°C to the reflux point of the solvent and with or without a trialkylamine base.

Table B: Preparation of ketone linkages between A and B.

Rxn. No.	if A contains :	then the reactive substituent of Y is :	to give the following product A-X-Y :
1	$A-C(O)Cl$	$BrMg-Y$	$A-C(O)-Y$

The coupling chemistry of Table B can be carried out by a variety of methods. The Grignard reagent required for Y is prepared from a halogen analog of Y in dry ether, dimethoxyethane or tetrahydrofuran at 0°C to the reflux point of the solvent. This Grignard reagent can be reacted directly under very controlled conditions, that is low temperature (-20°C or lower) and with a large excess of acid chloride or with catalytic or stoichiometric copper bromide•dimethyl sulfide complex in dimethyl sulfide as a solvent or with a variant thereof. Other methods available include transforming the Grignard reagent to the cadmium reagent and coupling according to the procedure of Carson and Prout (Org. Syn. Col. Vol. 3 (1955) 601) or a coupling mediated by $Fe(acac)_3$ according to Fiandanese et al. (*Tetr. Lett.* **1984**, 4805), or a coupling mediated by manganese (II) catalysis (Cahiez and Laboue, *Tetr. Lett.* **1992**, 33(31), 4437).

**Table C: Preparation of ether and thioether linkages between

7-Aminoisoquinoline (6.26 g, 43.4 mmol) (*J. Chem. Soc. 1951*, 2851) is added to 40 mL of concentrated hydrochloric
15 acid at 0°C. Sodium nitrite (3.0 g, 43.4 mmol) is dissolved in 15 mL water, cooled to 0°C, and added dropwise to the isoquinoline solution. The reaction is stirred for 30 min at 0°C. Stannous chloride dihydrate (29.3 g, 130.2 mmol, 3 eq) is dissolved in 25 mL concentrated hydrochloric acid, the
20 solution cooled to 0°C, and added dropwise to the isoquinoline solution. The reaction is placed in the refrigerator overnight. The next day the precipitate is isolated by filtration, washed with 100 mL ice cold brine followed by 100 mL of a 2:1 petroleum ether/ethyl ether solution. The brown

**5-(Furan-2-yl)-3-trifluoromethyl-1-(3-carboxynaphth-2-yl)-1H-
30 pyrazole:** A mixture of 1,1,1-trifluoro-4-(furan-2-yl)-2,4-
butadione (4.2 g, 20.4 mmol) and the hydrazine prepared above
(6.66 g) in MeOH (150 ml) and TFA (2.32 g, 20.4 mmol) was
stirred at ambient temperature for 5 days. The reaction was
evaporated and redissolved in EtOAc and washed with 1N HCl.
35 The EtOAc solution was dried (MgSO₄) and evaporated to give
5.0 g of material. The desired product was isolated by MPLC
on 300 g of flash silica gel using a gradient of 1% MeOH in
CHCl₃ to 3% MeOH in CHCl₃. Fractions were collected in 25 mL

portions with fractions 1-100 eluted with 1% MeOH in CHCl₃, fractions 101-300 eluted with 2% MeOH in CHCl₃ and fractions 301-500 eluted with 3% MeOH in CHCl₃. The title compound (1.52 g) was recovered from fractions 201-500; LRMS (M+H)⁺ m/z: 373.2.

5-(Furan-2-yl)-3-trifluoromethyl-1-(3'-hydroxymethylnaphth-2'-yl)-1H-pyrazole:

To 1.52 g of 5-(furan-2-yl)-3-trifluoromethyl-1-(3'-carboxynaphth-2'-yl)-1H-pyrazole (4.1 mmol) in THF (100 ml) at 0 °C was added N-methylmorpholine (4.5 mmol, 0.46 g) followed by isobutylchloroformate (4.5 mmol, 0.62 g). The reaction was maintained at 0 °C for 1 h then filtered into a solution of NaBH₄ (12.3 mmol, 0.47 g) in water (50 ml) at 0 °C. The THF was removed by evaporation, then the residue partitioned between EtOAc and 1N HCl. The EtOAc layer was dried and evaporated to give 1.57 g of the benzyl alcohol; LRMS (M+Na)⁺ m/z: 381.1.

5-(Furan-2-yl)-3-trifluoromethyl-1-(3'-azidomethylnaphth-2'-yl)-1H-pyrazole:

To 5-(furan-2-yl)-3-trifluoromethyl-1-(3'-hydroxymethylnaphthal-2'-yl)-1H-pyrazole (4.4 mmol, 1.57 g) and N-methylmorpholine (4.8 mmol, 0.49 g) in CH₂Cl₂ (100 ml) at 0 °C was added methanesulfonyl chloride (4.8 mmol, 0.55 g) in CH₂Cl₂ (20 ml). The reaction was allowed to thaw to ambient temperature over 5 h. The reaction was then washed with cold 1N HCl, dried (MgSO₄) and evaporated to give 1.82 g of the mesylate. This material was immediately dissolved in DMF (20 ml) and sodium azide (13.2 mmol, 0.92 g) added. The reaction was stirred for 18 h, then diluted with brine and extracted with EtOAc. The EtOAc extract was washed with brine (5 x's), dried (MgSO₄) and evaporated to give 1.37 g of crude product. This material was purified to homogeneity by MPLC on a 360 g column of flash silica by eluting with 10: 1 hexane: EtOAc. Fractions were collected in 25 ml portions and 0.75 g of 5-(furan-2-yl)-3-trifluoromethyl-1-(3'-azidomethylnaphth-2'-yl)-1H-pyrazole was recovered from fractions 68-100; LRMS (M+H)⁺ m/z: 384.0, (M+Na)⁺ m/z: 406.1.

3-Trifluoromethyl-1-(3'-azidomethylnaphth-2'-yl)-1H-pyrazole-5-carboxylic acid:

After TLC (5: 1 Hexane: EtOAc) indicated that all of the starting material was consumed (ca. 4 h) the reaction was cooled to ambient temperature and filtered through a pad of Celite®. The pad was washed thoroughly with acetone then the combined filtrate was condensed to remove the acetone. The remaining water suspension was made basic with 1N NaOH (pH 11) and the resulting solution washed with Et₂O. The basic solution was acidified with 1N HCl (pH 2) and extracted with EtOAc. The extracts were dried and evaporated to give the title acid (0.54 g); LRMS (M-H)⁻ m/z: 360.

The reaction was evaporated and pumped on for several hours to remove the last traces of reagent to give 0.59 g of acid chloride. The acid chloride was combined with 2-fluoro-4-(2-methanesulfonylphenyl)aniline (1.7 mmol, 0.50 g) and DMAP (4.5 mmol, 0.55 g) in CH₂Cl₂ (25 ml) and stirred at ambient temperature for 18 h. Utility

The compounds of this invention are useful as anticoagulants for the treatment or prevention of thromboembolic disorders in mammals. The term "thromboembolic disorders" as used herein includes arterial or venous cardiovascular or cerebrovascular thromboembolic disorders, including, for example, unstable angina, first or recurrent myocardial infarction, ischemic sudden death, transient ischemic attack, stroke, atherosclerosis, venous thrombosis, deep vein thrombosis, thrombophlebitis, arterial embolism, coronary and cerebral arterial thrombosis, cerebral embolism, kidney embolisms, and pulmonary embolisms. The anticoagulant effect of compounds of the present invention is believed to be due to inhibition of factor Xa or thrombin.

The effectiveness of compounds of the present invention as inhibitors of factor Xa was determined using purified human factor Xa and synthetic substrate. The rate of factor Xa hydrolysis of chromogenic substrate S2222 (Kabi Pharmacia, Franklin, OH) was measured both in the absence and presence of compounds of the present invention. Hydrolysis of the substrate resulted in the release of pNA, which was monitored spectrophotometrically by measuring the increase in absorbance at 405 nM. A decrease in the rate of absorbance change at 405 nm in the presence of inhibitor is indicative of enzyme inhibition. The results of this assay are expressed as inhibitory constant, K_i .

Factor Xa determinations were made in 0.10 M sodium phosphate buffer, pH 7.5, containing 0.20 M NaCl, and 0.5 % PEG 8000. The Michaelis constant, K_m , for substrate hydrolysis was determined at 25°C using the method of Lineweaver and Burk. Values of K_i were determined by allowing 0.2-0.5 nM human factor Xa (Enzyme Research Laboratories, South Bend, IN) to react with the substrate (0.20 mM-1 mM) in the presence of inhibitor. Reactions were allowed to go for 30 minutes and the velocities (rate of absorbance change vs time) were measured in the time frame of 25-30 minutes. The following relationship was used to calculate K_i values:

$$(v_o - v_s) / v_s = I / (K_i (1 + S / K_m))$$

where:

v_0 is the velocity of the control in the absence of inhibitor;

v_s is the velocity in the presence of inhibitor;

5 I is the concentration of inhibitor;

K_i is the dissociation constant of the enzyme:inhibitor complex;

S is the concentration of substrate;

K_m is the Michaelis constant.

10 Using the methodology described above, a number of compounds of the present invention were found to exhibit a K_i of $\leq 15 \mu M$, thereby confirming the utility of the compounds of the present invention as effective Xa inhibitors.

15 The antithrombotic effect of compounds of the present invention can be demonstrated in a rabbit arterio-venous (AV) shunt thrombosis model. In this model, rabbits weighing 2-3 kg anesthetized with a mixture of xylazine (10 mg/kg i.m.) and ketamine (50 mg/kg i.m.) are used. A saline-filled AV shunt device is connected between the femoral arterial and the
20 femoral venous cannulae. The AV shunt device consists of a piece of 6-cm tygon tubing which contains a piece of silk thread. Blood will flow from the femoral artery via the AV-shunt into the femoral vein. The exposure of flowing blood to a silk thread will induce the formation of a significant
25 thrombus. After forty minutes, the shunt is disconnected and the silk thread covered with thrombus is weighed. Test agents or vehicle will be given (i.v., i.p., s.c., or orally) prior to the opening of the AV shunt. The percentage inhibition of thrombus formation is determined for each treatment group.
30 The ID50 values (dose which produces 50% inhibition of thrombus formation) are estimated by linear regression.

The compounds of formula (I) may also be useful as inhibitors of serine proteases, notably human thrombin, plasma kallikrein and plasmin. Because of their inhibitory action,
35 these compounds are indicated for use in the prevention or treatment of physiological reactions, blood coagulation and inflammation, catalyzed by the aforesaid class of enzymes. Specifically, the compounds have utility as drugs for the

treatment of diseases arising from elevated thrombin activity such as myocardial infarction, and as reagents used as anticoagulants in the processing of blood to plasma for diagnostic and other commercial purposes.

5 Some compounds of the present invention were shown to be direct acting inhibitors of the serine protease thrombin by their ability to inhibit the cleavage of small molecule substrates by thrombin in a purified system. *In vitro* inhibition constants were determined by the method described
10 by Kettner et al. in *J. Biol. Chem.* **265**, 18289-18297 (1990), herein incorporated by reference. In these assays, thrombin-mediated hydrolysis of the chromogenic substrate S2238 (Helena Laboratories, Beaumont, TX) was monitored spectrophotometrically. Addition of an inhibitor to the assay
15 mixture results in decreased absorbance and is indicative of thrombin inhibition. Human thrombin (Enzyme Research Laboratories, Inc., South Bend, IN) at a concentration of 0.2 nM in 0.10 M sodium phosphate buffer, pH 7.5, 0.20 M NaCl, and 0.5% PEG 6000, was incubated with various substrate
20 concentrations ranging from 0.20 to 0.02 mM. After 25 to 30 minutes of incubation, thrombin activity was assayed by monitoring the rate of increase in absorbance at 405 nm which arises owing to substrate hydrolysis. Inhibition constants were derived from reciprocal plots of the reaction velocity as
25 a function of substrate concentration using the standard method of Lineweaver and Burk. Using the methodology described above, some compounds of this invention were evaluated and found to exhibit a K_i of less than 15 μ m, thereby confirming the utility of the compounds of the present
30 invention as effective Xa inhibitors.

The compounds of the present invention can be administered alone or in combination with one or more additional therapeutic agents. These include other anti-coagulant or coagulation inhibitory agents, anti-platelet or
35 platelet inhibitory agents, thrombin inhibitors, or thrombolytic or fibrinolytic agents.

The compounds are administered to a mammal in a therapeutically effective amount. By "therapeutically

effective amount" it is meant an amount of a compound of Formula I that, when administered alone or in combination with an additional therapeutic agent to a mammal, is effective to prevent or ameliorate the thromboembolic disease condition or the progression of the disease.

By "administered in combination" or "combination therapy" it is meant that the compound of Formula I and one or more additional therapeutic agents are administered concurrently to the mammal being treated. When administered in combination each component may be administered at the same time or sequentially in any order at different points in time. Thus, each component may be administered separately but sufficiently closely in time so as to provide the desired therapeutic effect. Other anticoagulant agents (or coagulation inhibitory agents) that may be used in combination with the compounds of this invention include warfarin and heparin, as well as other factor Xa inhibitors such as those described in the publications identified above under Background of the Invention.

The term anti-platelet agents (or platelet inhibitory agents), as used herein, denotes agents that inhibit platelet function such as by inhibiting the aggregation, adhesion or granular secretion of platelets. Such agents include, but are not limited to, the various known non-steroidal anti-inflammatory drugs (NSAIDS) such as aspirin, ibuprofen, naproxen, sulindac, indomethacin, mefenamate, droxicam, diclofenac, sulfinpyrazone, and piroxicam, including pharmaceutically acceptable salts or prodrugs thereof. Of the NSAIDS, aspirin (acetylsalicyclic acid or ASA), and piroxicam are preferred. Other suitable anti-platelet agents include ticlopidine, including pharmaceutically acceptable salts or prodrugs thereof. Ticlopidine is also a preferred compound since it is known to be gentle on the gastro-intestinal tract in use. Still other suitable platelet inhibitory agents include IIb/IIIa antagonists, thromboxane-A₂-receptor antagonists and thromboxane-A₂-synthetase inhibitors, as well as pharmaceutically acceptable salts or prodrugs thereof.

5 The term thrombin inhibitors (or anti-thrombin agents),
as used herein, denotes inhibitors of the serine protease
thrombin. By inhibiting thrombin, various thrombin-mediated
processes, such as thrombin-mediated platelet activation (that
10 is, for example, the aggregation of platelets, and/or the
granular secretion of plasminogen activator inhibitor-1 and/or
serotonin) and/or fibrin formation are disrupted. A number of
thrombin inhibitors are known to one of skill in the art and
these inhibitors are contemplated to be used in combination
15 with the present compounds. Such inhibitors include, but are
not limited to, boroarginine derivatives, boropeptides,
heparins, hirudin and argatroban, including pharmaceutically
acceptable salts and prodrugs thereof. Boroarginine
derivatives and boropeptides include N-acetyl and peptide
20 derivatives of boronic acid, such as C-terminal α -aminoboronic
acid derivatives of lysine, ornithine, arginine, homoarginine
and corresponding isothiuronium analogs thereof. The term
hirudin, as used herein, includes suitable derivatives or
analogs of hirudin, referred to herein as hirulogs, such as
25 disulfatohirudin. Boro peptide thrombin inhibitors include
compounds described in Kettner et al., U.S. Patent No.
5,187,157 and European Patent Application Publication Number
293 881 A2, the disclosures of which are hereby incorporated
herein by reference. Other suitable boroarginine derivatives
and boro peptide thrombin inhibitors include those disclosed in
PCT Application Publication Number 92/07869 and European
Patent Application Publication Number 471,651 A2, the
disclosures of which are hereby incorporated herein by
reference.

30 The term thrombolytics (or fibrinolytic) agents (or
thrombolytics or fibrinolytics), as used herein, denotes
agents that lyse blood clots (thrombi). Such agents include
tissue plasminogen activator, anistreplase, urokinase or
streptokinase, including pharmaceutically acceptable salts or
35 prodrugs thereof. The term anistreplase, as used herein,
refers to anisoylated plasminogen streptokinase activator
complex, as described, for example, in European Patent
Application No. 028,489, the disclosure of which is hereby

incorporated herein by reference herein. The term urokinase, as used herein, is intended to denote both dual and single chain urokinase, the latter also being referred to herein as prourokinase.

5 Administration of the compounds of Formula I of the invention in combination with such additional therapeutic agent, may afford an efficacy advantage over the compounds and agents alone, and may do so while permitting the use of lower doses of each. A lower dosage minimizes the potential of side
10 effects, thereby providing an increased margin of safety.

The compounds of the present invention are also useful as standard or reference compounds, for example as a quality standard or control, in tests or assays involving the inhibition of factor Xa. Such compounds may be provided in a
15 commercial kit, for example, for use in pharmaceutical research involving factor Xa. For example, a compound of the present invention could be used as a reference in an assay to compare its known activity to a compound with an unknown activity. This would ensure the experimenter that the assay
20 was being performed properly and provide a basis for comparison, especially if the test compound was a derivative of the reference compound. When developing new assays or protocols, compounds according to the present invention could be used to test their effectiveness.

25 The compounds of the present invention may also be used in diagnostic assays involving factor Xa. For example, the presence of factor Xa in an unknown sample could be determined by addition of chromogenic substrate S2222 to a series of solutions containing test sample and optionally one of the
30 compounds of the present invention. If production of pNA is observed in the solutions containing test sample, but no compound of the present invention, then one would conclude factor Xa was present.

35 Dosage and Formulation

The compounds of this invention can be administered in such oral dosage forms as tablets, capsules (each of which includes sustained release or timed release formulations),

pills, powders, granules, elixirs, tinctures, suspensions, syrups, and emulsions. They may also be administered in intravenous (bolus or infusion), intraperitoneal, subcutaneous, or intramuscular form, all using dosage forms well known to those of ordinary skill in the pharmaceutical arts. They can be administered alone, but generally will be administered with a pharmaceutical carrier selected on the basis of the chosen route of administration and standard pharmaceutical practice.

The dosage regimen for the compounds of the present invention will, of course, vary depending upon known factors, such as the pharmacodynamic characteristics of the particular agent and its mode and route of administration; the species, age, sex, health, medical condition, and weight of the recipient; the nature and extent of the symptoms; the kind of concurrent treatment; the frequency of treatment; the route of administration, the renal and hepatic function of the patient, and the effect desired. A physician or veterinarian can determine and prescribe the effective amount of the drug required to prevent, counter, or arrest the progress of the thromboembolic disorder.

By way of general guidance, the daily oral dosage of each active ingredient, when used for the indicated effects, will range between about 0.001 to 1000 mg/kg of body weight, preferably between about 0.01 to 100 mg/kg of body weight per day, and most preferably between about 1.0 to 20 mg/kg/day. Intravenously, the most preferred doses will range from about 1 to about 10 mg/kg/minute during a constant rate infusion. Compounds of this invention may be administered in a single daily dose, or the total daily dosage may be administered in divided doses of two, three, or four times daily.

Compounds of this invention can be administered in intranasal form via topical use of suitable intranasal vehicles, or via transdermal routes, using transdermal skin patches. When administered in the form of a transdermal delivery system, the dosage administration will, of course, be continuous rather than intermittent throughout the dosage regimen.

The compounds are typically administered in admixture with suitable pharmaceutical diluents, excipients, or carriers (collectively referred to herein as pharmaceutical carriers) suitably selected with respect to the intended form of administration, that is, oral tablets, capsules, elixirs, syrups and the like, and consistent with conventional pharmaceutical practices.

For instance, for oral administration in the form of a tablet or capsule, the active drug component can be combined with an oral, non-toxic, pharmaceutically acceptable, inert carrier such as lactose, starch, sucrose, glucose, methyl cellulose, magnesium stearate, dicalcium phosphate, calcium sulfate, mannitol, sorbitol and the like; for oral administration in liquid form, the oral drug components can be combined with any oral, non-toxic, pharmaceutically acceptable inert carrier such as ethanol, glycerol, water, and the like. Moreover, when desired or necessary, suitable binders, lubricants, disintegrating agents, and coloring agents can also be incorporated into the mixture. Suitable binders include starch, gelatin, natural sugars such as glucose or beta-lactose, corn sweeteners, natural and synthetic gums such as acacia, tragacanth, or sodium alginate, carboxymethylcellulose, polyethylene glycol, waxes, and the like. Lubricants used in these dosage forms include sodium oleate, sodium stearate, magnesium stearate, sodium benzoate, sodium acetate, sodium chloride, and the like. Disintegrators include, without limitation, starch, methyl cellulose, agar, bentonite, xanthan gum, and the like.

The compounds of the present invention can also be administered in the form of liposome delivery systems, such as small unilamellar vesicles, large unilamellar vesicles, and multilamellar vesicles. Liposomes can be formed from a variety of phospholipids, such as cholesterol, stearylamine, or phosphatidylcholines.

Compounds of the present invention may also be coupled with soluble polymers as targetable drug carriers. Such polymers can include polyvinylpyrrolidone, pyran copolymer, polyhydroxypropylmethacrylamide-phenol,

polyhydroxyethylaspartamidophenol, or polyethyleneoxide-
polylysine substituted with palmitoyl residues. Furthermore,
the compounds of the present invention may be coupled to a
class of biodegradable polymers useful in achieving

5 controlled release of a drug, for example, polylactic acid,
polyglycolic acid, copolymers of polylactic and polyglycolic
acid, polyepsilon caprolactone, polyhydroxy butyric acid,
polyorthoesters, polyacetals, polydihdropyrans,
polycyanoacylates, and crosslinked or amphipathic block
10 copolymers of hydrogels.

Dosage forms (pharmaceutical compositions) suitable for
administration may contain from about 1 milligram to about 100
milligrams of active ingredient per dosage unit. In these
pharmaceutical compositions the active ingredient will
15 ordinarily be present in an amount of about 0.5-95% by weight
based on the total weight of the composition.

Gelatin capsules may contain the active ingredient and
powdered carriers, such as lactose, starch, cellulose
derivatives, magnesium stearate, stearic acid, and the like.
20 Similar diluents can be used to make compressed tablets. Both
tablets and capsules can be manufactured as sustained release
products to provide for continuous release of medication over
a period of hours. Compressed tablets can be sugar coated or
film coated to mask any unpleasant taste and protect the
25 tablet from the atmosphere, or enteric coated for selective
disintegration in the gastrointestinal tract.

Liquid dosage forms for oral administration can contain
coloring and flavoring to increase patient acceptance.

In general, water, a suitable oil, saline, aqueous
30 dextrose (glucose), and related sugar solutions and glycols
such as propylene glycol or polyethylene glycols are suitable
carriers for parenteral solutions. Solutions for parenteral
administration preferably contain a water soluble salt of the
active ingredient, suitable stabilizing agents, and if
35 necessary, buffer substances. Antioxidizing agents such as
sodium bisulfite, sodium sulfite, or ascorbic acid, either
alone or combined, are suitable stabilizing agents. Also used
are citric acid and its salts and sodium EDTA. In addition,

parenteral solutions can contain preservatives, such as benzalkonium chloride, methyl- or propyl-paraben, and chlorobutanol.

Suitable pharmaceutical carriers are described in
5 Remington's Pharmaceutical Sciences, Mack Publishing Company,
a standard reference text in this field.

Representative useful pharmaceutical dosage-forms for
administration of the compounds of this invention can be
illustrated as follows:

10 Capsules

A large number of unit capsules can be prepared by
filling standard two-piece hard gelatin capsules each with 100
milligrams of powdered active ingredient, 150 milligrams of
lactose, 50 milligrams of cellulose, and 6 milligrams
15 magnesium stearate.

Soft Gelatin Capsules

A mixture of active ingredient in a digestable oil
such as soybean oil, cottonseed oil or olive oil may be
prepared and injected by means of a positive displacement pump
20 into gelatin to form soft gelatin capsules containing 100
milligrams of the active ingredient. The capsules should be
washed and dried.

Tablets

Tablets may be prepared by conventional procedures so
25 that the dosage unit is 100 milligrams of active ingredient,
0.2 milligrams of colloidal silicon dioxide, 5 milligrams of
magnesium stearate, 275 milligrams of microcrystalline
cellulose, 11 milligrams of starch and 98.8 milligrams of
lactose. Appropriate coatings may be applied to increase
30 palatability or delay absorption.

Injectable

A parenteral composition suitable for administration
by injection may be prepared by stirring 1.5% by weight of
active ingredient in 10% by volume propylene glycol and water.
35 The solution should be made isotonic with sodium chloride and
sterilized.

Suspension

An aqueous suspension can be prepared for oral administration so that each 5 mL contain 100 mg of finely divided active ingredient, 200 mg of sodium carboxymethyl cellulose, 5 mg of sodium benzoate, 1.0 g of sorbitol solution, U.S.P., and 0.025 mL of vanillin.

Where the compounds of this invention are combined with other anticoagulant agents, for example, a daily dosage may be about 0.1 to 100 milligrams of the compound of Formula I and about 1 to 7.5 milligrams of the second anticoagulant, per kilogram of patient body weight. For a tablet dosage form, the compounds of this invention generally may be present in an amount of about 5 to 10 milligrams per dosage unit, and the second anti-coagulant in an amount of about 1 to 5 milligrams per dosage unit.

Where the compounds of Formula I are administered in combination with an anti-platelet agent, by way of general guidance, typically a daily dosage may be about 0.01 to 25 milligrams of the compound of Formula I and about 50 to 150 milligrams of the anti-platelet agent, preferably about 0.1 to 1 milligrams of the compound of Formula I and about 1 to 3 milligrams of antiplatelet agents, per kilogram of patient body weight.

Where the compounds of Formula I are administered in combination with thrombolytic agent, typically a daily dosage may be about 0.1 to 1 milligrams of the compound of Formula I, per kilogram of patient body weight and, in the case of the thrombolytic agents, the usual dosage of the thrombolytic agent when administered alone may be reduced by about 70-80% when administered with a compound of Formula I.

Where two or more of the foregoing second therapeutic agents are administered with the compound of Formula I, generally the amount of each component in a typical daily dosage and typical dosage form may be reduced relative to the usual dosage of the agent when administered alone, in view of the additive or synergistic effect of the therapeutic agents when administered in combination.

Particularly when provided as a single dosage unit, the potential exists for a chemical interaction between the combined active ingredients. For this reason, when the compound of Formula I and a second therapeutic agent are combined in a single dosage unit they are formulated such that although the active ingredients are combined in a single dosage unit, the physical contact between the active ingredients is minimized (that is, reduced). For example, one active ingredient may be enteric coated. By enteric coating one of the active ingredients, it is possible not only to minimize the contact between the combined active ingredients, but also, it is possible to control the release of one of these components in the gastrointestinal tract such that one of these components is not released in the stomach but rather is released in the intestines. One of the active ingredients may also be coated with a material which effects a sustained-release throughout the gastrointestinal tract and also serves to minimize physical contact between the combined active ingredients. Furthermore, the sustained-released component can be additionally enteric coated such that the release of this component occurs only in the intestine. Still another approach would involve the formulation of a combination product in which the one component is coated with a sustained and/or enteric release polymer, and the other component is also coated with a polymer such as a lowviscosity grade of hydroxypropyl methylcellulose (HPMC) or other appropriate materials as known in the art, in order to further separate the active components. The polymer coating serves to form an additional barrier to interaction with the other component.

These as well as other ways of minimizing contact between the components of combination products of the present invention, whether administered in a single dosage form or administered in separate forms but at the same time by the same manner, will be readily apparent to those skilled in the art, once armed with the present disclosure.

Obviously, numerous modifications and variations of the present invention are possible in light of the above teachings. It is therefore to be understood that within the

scope of the appended claims, the invention may be practiced otherwise than as specifically described herein.
